

TENDRAIN 7100-2 Double-Sided Geocomposite

The drainage geocomposite is comprised of a tri-axial geonet structure with thermally bonded nonwoven geotextiles on both sides. The product is capable of providing high transmissivity in a soil environment under both low and high loads and will have properties conforming to the values and test methods listed below.

PROPERTY	TEST METHODS	UNITS	VALUE	QUALIFIER	TEST FREQUENCY

NOTES: **1.** Geotextile and geonet properties listed are prior to lamination. **2.** Tri-axial geonet consists of thick main-ribs with diagonally placed top and bottom-ribs. **3.** Creep Reduction Factor is based on 10,000 hour test duration, extrapolated to 30 years, under the corresponding compressive load and temperature. **4.** Hydraulic properties: AOS and permittivity are only applicable to the top filter geotextile. **5.** Geocomposite transmissivity measured by manufacturer per ASTM D4716 with testing boundary conditions as follows: steel plate / Ottawa sand / geocomposite / 60 mil HDPE geomembrane / steel plate, and seating period of 100 hours according to GRI-GC8, with the stronger side of the geocomposite facing the soft boundary condition as indicated with top (soil) /bottom (liner) label on the rolls. Digital indicator of hydraulic gradient is required during the transmissivity measurement at low gradients.
