

Hortonova

Crop Support Net

Vertical Applications

1. Set supporting posts at a distance of 25 ft apart and stretch a cable from the top of one post to the other.
2. Secure the net to the initial post with a nylon string. (It is not advisable to fasten the netting to single points, or to stretch it.)
3. Attach netting along the cable by running the nylon string through the top meshes.

Horizontal Applications

1. Erect strong wood or metal support posts with pre-drilled holes for each layer of net required during the growth cycle.
2. Support posts should be set at a maximum distance of 20 feet apart.
3. Bolt a wooden crossbar between each set of support posts at the first level.
4. Pull mesh taut and attach or weave netting to the wood crossbar.
5. For added support, weave a 16 gauge wire along the edge of the netting and vertical support posts. If a support wire is not used during the growth cycle of heavier crops, slack in the mesh can be eliminated by simply pulling the mesh taut and re-attaching posts.
6. Add subsequent layers of netting as growth cycle progresses.
